

29 Jan 2020 | **Analysis**

QUOTED. 29 January 2020. Neal Batra.

by

By 2040, the health-care industry will see a major transformation where consumers enabled by digital technologies and open source, secure access to health data will be able to manage their own health, according to a Deloitte analysis. A panel of experts discussed Deloitte's vision for the future of health care during CES 2020. See what Neal Batra, a principal in Deloitte's Life Sciences and Health Care practice, said about it here.

"The explosion of granular, robust and individualized data and the ability to link disparate sources – through open source, secure platforms – allowing that data to come together, will drive this change and will create a holistic [and individualized] picture of our health through wearables and the next-generation 'always-on sensors' that are embedded in the devices around us." – Neal Batra, principal, Deloitte's Life Sciences and Health Care practice
