QUOTED. 26 March 2021. Siqi Tan.

by

Thermo Fisher's new AerosolSense Bioaerosol Sampler is being used in hospitals to detect COVID-19 particles in the air. Company general manager Siqi Tan discussed its operation with *Medtech Insight*.

“There are only three simple steps to operating the device: you open the door, you insert the cartridge, and you close the door. Once the sampler finishes its job, you open the door again you pull out the cartridge. This cartridge goes into a bag, and then to the lab.” – Siqi Tan, general manager for environmental and process monitoring, Thermo Fisher
